3. Q&A

Please find below more answers to queries from potential bidders:

#	Query	Answer
1	<p>In page 14 of RFP, “specific objectives”:</p> <p><i>A set of web-based solutions to integrate a set of data analytics, stories, graphics and data management tools on the website in consultation with related stakeholders. These solutions should enable real time data analytics, Geo-spatial data platform, interactive spaces for relevant open-source data-sharing</i></p> <p>1a. What do you mean by "real time analytics"? Input, output, if you have any sample, please send us for our analysis?</p> <p>1b. Are there any special requirements for the platform of this Geo-spatial data? If yes, on which platform?</p> <p>1c. Which standard does the “open-source data-sharing sharing” base on?</p>	<p>1a. This would be quarterly updates of dashboard information (number houses completed, hectares mangroves restored etc)</p> <p>1b. No</p> <p>1c. Key data and reports should be available for download to the extent possible.</p>
2	<p>Tool "Site map"</p> <p>2a. Dashboard to track project progress: Will this data show on Geo-spatial map?</p>	<p>2a. The geo-spatial map can be relatively simple, but it would be good if that least key dashboard data can be shown by provinces (ie: a map of project provinces with the number of houses rebuilt there)</p>

	<p>2b. Maps of project activities and progress: Will this data show on Geo-spatial map?</p> <p>2c. Information and links to climate risk maps and other sites associated with the project: Are climate risk maps available and we just need to put a link to them or they will be created?</p>	<p>2b. In a basic sense, for example number of houses per provinces/ maybe district, but not exact location</p> <p>2c. Yes, this is being down through another piece of work so you don't need to develop risk maps.</p>
