I. Background Information

Trash has long been a major problem in big cities. Domestic waste produced by households needs proper handling. In addition to household waste, there is also waste generated by chemical processes. This type of waste needs to be handled more thoroughly because of its toxic nature.

There is also a positive aspect of the waste. It has economic value, as waste can be recycled and reproduced to be other goods. Knowing this value, it is suggested that when managing waste, as much as possible we need to recycle the waste. However, we need to make sure that the recyclers know how to handle the waste and are able to separate the hazardous materials and the materials that can be used further.

In managing waste it is essential if there is a depot available. A depot is a place for the storage of large quantities of something. The depot will be a place to store waste. And it is in this depot that the waste will be handled effectively, by separating it into hazardous waste and waste that can be used to make new products.

The depot will be an intermediary post and it has crucial functions such as:

1. It helps preventing the transmission of dangerous pollutant;
2. It increases the value of waste. Some of the waste can be processed and transformed into new products;
3. It brings economic benefit for the management of the depot, by selling the useful waste (mostly plastic);
4. It becomes learning center

While the process of mini depot construction is on going, it is also essential to prepare the equipment needed for the operational of the mini depot. The equipment needed consists of belt conveyor, weighing scale, mobile racks, pressing machine and CRF. The provision of the equipment should be conducted soon to make sure that it should be installed on the mini depot facility during the construction period.
