## Chart of Matching and Sampling for EALG Mid-term Evaluation

- Matching has been completed at all levels at baseline survey using the results of the past UZP/UP performance assessment. Baseline study
  has also identified mauzas for both treatment and control groups covering all Sub-Groups (1 to 4) by using simple random sampling method.
  Please see a separate list of treatment groups and control groups.
- Household sample size has also been determined by baseline survey (Treatment group: 2,550 HHs/ Control group: 1,250 HHs).
- The firm is expected to select households from identified treatment Mauzas and control Mauzas by using an appropriate sampling method.
