Analysis of eDNA Water Samples (Molecular Sample Processing Services) for Sawfish

A. General Information

Title	: Analysis of eDNA Water Samples for Sawfish
Project No	00100050 – ATSEA Phase 2
Report to	: National Project Coordinator ATSEA-2
Location	: JL Pasir Putih II RT.11/RW.10, RT.3/RW.10, Ancol, Pademangan, North Jakarta City, Jakarta, 14430
Duration of contract	: The expected duration of the contract is 2 months calculated based on the contract starting date
Location	: Home based and Merauke District

B. Background

The Arafura and Timor Seas (ATS) is part of the North Australian Shelf large marine ecosystem (LME), which is a tropical sea lying between the Pacific and Indian Oceans and extending from the Timor Sea to the Torres Strait and including the Arafura Sea and Gulf of Carpentaria. The region is adjacent to the Coral Triangle¹, which hosts the world's highest marine biodiversity and contains some of the most pristine and highly threatened coastal and marine ecosystems. At the regional scale, the ecosystems of the ATS play an important economic and ecological role in the littoral nations bordering the Arafura and Timor Sea: Indonesia, Timor-Leste, Australia, and Papua New Guinea.

The marine environment in the ATS region is in serious decline, primarily as a result of overharvesting and other direct and indirect impacts of anthropogenic stresses and global climatic changes. Fisheries in the ATS region represent an extremely complex productive, socioeconomic sector, with multiple actors, target species sought, and technology used. The main characteristics of depletion of shared ATS transboundary stocks by fishery were assessed as part of the ATS transboundary diagnostic analysis (TDA) in 2012. In addition to climate change, unsustainable harvesting, illegal unreported unregulated (IUU) fishing, and bycatch are having significant impacts on the populations of key marine species in the ATS region, particularly globally threatened coastal marine megafauna including migratory, rare, and threatened species of turtles, dugongs, seabirds/shorebirds, sea snakes, cetaceans, sharks and rays. Lastly, potential sources of marine pollution in the ATS region include marine debris, marine based pollution from oil and gas activities, as well as waste from fishing and shipping vessels.

This project will cover the five priority transboundary environmental problems identified by the TDA: (i) unsustainable fisheries and decline and loss of living coastal and marine resources; (ii) modification, degradation and loss of coastal and marine habitats; (iii) marine and land-based

¹The Coral Triangle is a marine area located in the western Pacific Ocean, and including the waters of Indonesia, Malaysia, the Philippines, Papua New Guinea, Timor-Leste and Solomon Islands.

pollution; (iv) the decline and loss of threatened and migratory species; and (v) impacts of climate change on the ATS

This project is building upon the foundational results realized in the first phase of the ATSEA program, which applied the tried and tested GEF International Waters focal area approach, starting with a participatory transboundary diagnostic analysis (TDA) and followed by development of a regional strategic action program (SAP) and national action programs (NAPs). This second phase of the ATSEA program, is designed to support the initial implementation of the ATS SAP, endorsed through Ministerial Declaration in 2014.

Scope of work

The vendor will responsible to laboratory analyzing from eDNA water samples that already provided by ATSEA-2 Program from field to support research of Sawfish species for zonation plan in the Marine Protected Area (MPA) of Kolepom Island. This eDNA method is used as a survey activity to find information on the possibility of genetic material being left in a water area, specifically on Kolepom Island. This analysis will greatly support the results of data collection required to be used in supporting data analysis and preparation of the preliminary documents for developing zonation plan for Kolepom MPA in Merauke district. This will also help convey important data and information that will be reported to the MMAF and other relevant stakeholders. Therefore, partners and decision makers can find out important information regarding the species of sawfish in Kolepom Island.

In order to carry out the planned eDNA testing and process the analyses of collected samples, ATSEA-2 is seeking a reliable service provider who could carry out the following assignments:

1. To withdraw the existing eDNA water samples from the existing storage in Bogor to the selected lab
2. Analysis of collected eDNA water samples for sawfish species using elasmobranch specific primer in order to provide reliable result
3. Prepare Final Report – narrative summary and interpretation of the results of performed analysis.

The analysis of eDNA water samples is carried out by companies (vendors) for molecular sample processing services. The analysis should using elasmobranch specific primer to provide the most reliable data analysis. The vendor will provide raw sequence analysis and support lab and bioinformatic analysis to identified the presence of sawfish species and other elasmobranch species composition.

The analytical work will be performed at the laboratory facilities of the service provider with the following description including the estimated timeline.
